

## **Final Reflection**

Upon completion of the self-reflection for Programming for Design I am happy with how the 8Bit representation came out. My goal was to have it represent a programmer. I feel this was achieved with me being in front of the monitor with lines of code. The goal for interactivity of the self-portrait was to have the lines of code on the monitor to scroll with the user's mouse wheel while staying within the bounds of the monitor and not scrolling off the screen. This was also too basic and didn't have enough interactivity with the self-portrait so adding a day and night function to the window was added to add more to the portrait.
