Programming for Design: Final Reflection Statement
Daniel Hall: U3201585

The creation of my HTML document was quite difficult as I have never touched or used any form of programming before starting this class. I struggled throughout the early stages of creating a portrait using java script but eventually got the hang of placing shapes throughout different points of the canvas. I began to understand the basics of this side of programming and enjoyed creating a portrait.

I'm proud of the final product I have delivered although I'm not sure how well it will weigh up against the rest of then classes. The beard took a very long time to do using different sizes of quads and triangles and was extremely tedious to create. I also think that the jacket turned out quite nicely. When the image is clicked on, the picture changes into a beardless / shirtless version which I find very amusing and funny.

Overall, I believe I have completed all requirements and that the image, although cartoonish, turned out quite nicely.

Thanks for all the help Simon, couldn't have finished without you.
